¹ We are obligated to report to you the maximum value detected during the analyses of multiple samples of drinking water collected during the past calendar year.

² The values listed here are the overall range of results that were recorded during multiple tests conducted in the past calendar year on the drinking water.

³ There were 3 days during the month of December when the fluoride feed was turned off due to a potential leak.

⁴ The maximum amount detected is not a violation. A chlorine residual was detected in the sample, and additional testing demonstrated no presence of e.Coli bacteri

⁵ This is the highest average value calculated for all the locations where THMs and HAAs are sampled during calendar year 2015

⁶ The values in the range are based on individual values rather than averages

⁷ EPA has established a lifetime health advisory (HA) value of 300 ppb for manganese to protect against concerns of potential neurological effects, and a one-day and 10-day HA of 1000 ppb for acute exposure

⁸ Sodium is naturally present in the environment and the raw water treated for drinking, at levels above the DEP Guideline of 20 ppm.

This value is strictly a guideline, and does not imply that a value higher than 20 ppm poses risk. The water treatment process does not remove sodium from the water
